

set - E.

Group - B

a) ~~a) →~~ It states that for the stream line flow of an ideal liquid, the total energy ( $\rho \left( \frac{1}{2} v^2 + P + \rho g h \right)$  per unit mass remains constant at every cross-section throughout the flow.

Application

(1) Atomiser or sprayer.

$$b) \quad P_1 + \frac{1}{2} \rho v_1^2 = P_2 + \frac{1}{2} \rho v_2^2$$

$$P_1 + 0 = P_2 + \frac{1}{2} \rho v_2^2$$

$$P_1 - P_2 = \Delta P = \frac{1}{2} \rho v_2^2$$

$$\Delta P = \frac{1}{2} \times 1.29 \times 30$$

$$= 540 \text{ Pa}$$

By defn,

$$F = \Delta P A = 540 \text{ Pa} \times 300 = \cancel{162000} \\ = 174150 \text{ N}$$

②

⊗ →

$$W = 2200 \text{ J}$$

$$Q_2 = 4300 \text{ J}$$

$$Q_1 = ?$$

$$W = Q_1 - Q_2$$

$$Q_1 = 2200 + 4300 \\ = 6500 \text{ J}$$

$$\eta = \left( 1 - \frac{Q_2}{Q_1} \right) \times 100\%$$

$$= \left( 1 - \frac{4300}{6500} \right) \times 100\%$$

$$= 33.8\%$$

③ a) → The maximum fluctuation in pressure at a point in medium when a longitudinal wave travels through it.

$$B = \frac{\text{change in pressure}}{\left( \frac{\text{change in volume}}{\text{original volume}} \right)}$$

$$= -\frac{P}{\frac{\Delta V}{V}} = -\frac{PV}{\Delta V}$$

$$V = A dx \quad \text{and} \quad \Delta V = A dy$$

$$B = -\frac{PV}{\Delta V} = -\frac{PA dx}{A dy} = -\frac{P dx}{dy}$$

$$P = -B \frac{dy}{dx}$$

on differentiating,

$$\frac{dy}{dx} = -ka \cos(\omega t - kx)$$

on substituting

$$P = -Bak \cos(\omega t - kx)$$

when  $\cos(\omega t - kx) = 1$

$$P = P_0$$

$$P = -P_0 \cos(\omega t - kx)$$

$$P_0 = Bak$$

$$\underline{\underline{P_0 \propto a}}$$

① → overtone means higher frequencies  
 ② → which when set in closed organ pipe makes node at one end and antinode at other end are called overtones.

Harmonic → A sound wave that has a frequency that is an integral multiple of a fundamental tone.

$$d_2 = d_2$$

$$d_2 = 2d_2$$

$$n_1 = n_2$$

$$\frac{v_1}{d_1} = \frac{v_1}{d_2}$$

$$\Rightarrow \frac{v_1}{4d_1} = \frac{v_1}{2d_2} = \frac{d_1}{2d_2} = \frac{1}{2}$$

on

$$\mu_r = \frac{\mu}{\mu_0}$$

② → current flowing in each two ~~long~~ infinitely long parallel conductors 4m apart, which results a force of exactly  $2 \times 10^{-7} \text{ N}$  per meter length on each conductor.

$$\text{①} \rightarrow \text{force on A due to C} = \frac{\mu_0 I^2 l}{2\pi(2a)}$$

$$= \frac{\mu_0 I^2 l}{4\pi a}$$

$$\text{force on A due to B} = \frac{\mu_0 I^2 l}{2\pi a}$$

$$\text{net force on A} = \frac{\mu_0 I^2 l}{2\pi a} - \frac{\mu_0 I^2 l}{4\pi a}$$

$$= -\frac{\mu_0 I^2 l}{4\pi a}$$

$$\text{③} \rightarrow B = \frac{\mu_0 I}{4\pi a}$$

$$60^\circ = \frac{\lambda}{3}$$

$$=$$

$$B = \frac{\mu_0 I}{4\pi} \times \frac{\lambda}{3}$$

$$= \frac{\mu_0 I}{12\pi} = \frac{\mu_0 \times 5}{12 \times 10^{-5}}$$

$$= 1.2 \times 10^{-4} \text{ T}$$

① → The time taken by a radioactive substance to disintegrate half of its atoms is called half life.

The mean life of a radioactive substance is equal to the sum of total life of the atoms divided by the total number of atoms in the element.

$$T_{\text{mean}} = \frac{1}{\lambda}$$

$$T = \frac{0.693}{\lambda}$$

$$T_{\text{mean}} = \frac{T}{0.693} = 1.443 T$$

• Mean life of a radioactive substance is longer than its half life.

① → The time taken by a radioactive substance to disintegrate half of its atoms is called half life.

The mean life of a radioactive substance is equal to the sum of total life of the atoms divided by the total number of atoms in the element.

$$T_{\text{mean}} = \frac{1}{\lambda}$$

$$T = \frac{0.693}{\lambda}$$

$$T_{\text{mean}} = \frac{T}{0.693} = 1.443 T$$

• Mean life of a radioactive substance is longer than its half life.

② (1) → 5

$$(1) \quad T_{1/2} = \frac{0.693}{\lambda} \quad \text{or } \lambda = \frac{0.693}{5} = 0.1386$$

$$T_{\text{avg}} = \frac{1}{\lambda} = \frac{1}{0.1386} = 7.21$$

(Pr. 1)

$$k_{1/2} = 5 \text{ min}$$

$$A_{A_0} = (1/2)^{t/k_{1/2}}$$

$$\frac{8000}{40000} = (1/2)^{t/5}$$

$$(1/2)^3 = (1/2)^{t/5}$$

$$\xi = 3/1$$

$$t = 15 \text{ min}$$

(8) (a)  $\rightarrow$  A heavy drop of P-N junction diode which works in reverse breakdown region with a sharp breakdown voltage is called zener diode.

(b)  $\rightarrow$  When the zener diode is reverse biased the junction potential increases. As the breakdown voltage is high this will provide high voltage handling capacity.

The zener diode and load resistance are connected in parallel such that the zener diode is reverse biased. The output voltage remains constant and is equal to zener voltage for the wide variation of input voltage and load resistance.

When  $V_{in} < V_z$ , then no current will flow through the zener diode.

When  $V_{in} > V_z$ , then the zener breakdown occurs and further increase in voltage will increase only ~~at~~ the current but the voltage remains constant.

Applying Kirchhoff's law at junction,

$$I = I_2 + I_L \quad \text{--- (1)}$$

If  $R_2$  be the zener diode resistance,

$$V_D = V_z$$

$$I_2 R_2 = I_L R_1$$

Applying Kirchhoff's voltage law,

$$I R_1 + V_z = V_{in}$$

$$V_z = V_{in} - I R_1 \quad \text{--- (1)}$$

$$V_D = V_{in} - I R_1 \quad \text{--- (2)}$$

When  $V_{in} < V_z$ , no voltage is required.

(g) (a) → Moment of inertia also be defined as ~~the~~ twice the K.E. of a rotating body when P.K angular velocity is unity.

from K.E of rotation of body,

$$K.E = \frac{I\omega^2}{2}$$

$$I = \sum_{i=1}^n m_i r_i^2$$

$$I = \frac{2 \times K.E}{\omega^2}$$

If  $\omega = 1$  rad/s, then  $I = 2 \times K.E$

(b) → rotational K.E =  $\frac{1}{2} I\omega^2$

If centre of mass has linear motion i.e., changes its position w.r.t time. So, it has linear P.E which is given by,

TO find K.E. (E) =  $E_P + E_T = \frac{1}{2} I \omega^2 + \frac{Mv^2}{2}$

Let 'r' be the radius of spherical body

$$\omega = v/r$$

$$I = MR^2$$

K.E. radius of rotation.

$$E = \frac{MR^2}{2} \left( \frac{v}{r} \right)^2 + \frac{Mv^2}{2}$$

$$\therefore E = \frac{Mv^2}{2} \left( \frac{R^2}{r^2} + 1 \right)$$

Q)  $400 \text{ kg m}^2$

$r = 0.2 \text{ m}$

$s = 2 \text{ m}$

$m = 1 \text{ kg}$

$\theta = 30^\circ$

W.S?

When the disc rolls down a distance  $s$  along the plane then

~~Loss of~~

Loss in P.E.

$= mgh = mg s \sin \theta$  — (1)

Total K.E. gained  $= \frac{1}{2} m v^2 + \frac{1}{2} I \omega^2$

$= \frac{1}{2} m v^2 + \frac{1}{2} I \omega^2$

$= \frac{1}{2} v^2 (m + I/r^2)$  — (2)

From eqn (1) & (2),

Loss P.E = 1/2 m v<sub>0</sub> P.E.

$$m g s \sin \theta = \frac{1}{2} m v^2 (m^2 + r^2)$$

$$\text{Ans, } 5 \times 10 \times 2 \times \sin 30^\circ = \frac{1}{2} v^2 [(5 \times 10)^2 + 0.1^2]$$

$$\text{Ans, } 50 = \frac{1}{2} v^2 \times 0.3$$

$$\text{Ans, } v^2 = \frac{50 \times 2}{0.3} = 333.33$$

$$\therefore v = \sqrt{333.33}$$

$$= 18.24 \text{ rad/s}$$

(a)  $\rightarrow$  When an body is completely submerged in water, the opposing force acting on the body are,

(i)  $f \propto \rho$

(ii)  $f \propto x$

(iii)  $f \propto v$

~~(iv)~~  $\therefore f \propto \rho v$

$f = 6\pi \eta r v$

Q →

Termination of velocity  $w = \frac{4}{3} r$

Let,  $r$  = radius of spherical ball  
 $\rho$  = density of material of spherical ball

$\sigma$  = density of liquid.

$\eta$  = coefficient of viscosity of liquid

$v$  = terminal velocity of spherical ball.

Then,  
Weight of spherical ball  $(W) = mg$

$$= \left( \frac{4}{3} \pi r^3 \right) \rho g$$

Upthrust of liquid  $(U) = \left( \frac{4}{3} \pi r^3 \right) \sigma g$

From Stokes law,

$$F = 6 \pi \eta r v$$

When a ball attains terminal velocity,

Total upward force  $U + F = W$

$$U + F = W$$

$$F = W - U$$

$$6 \frac{1}{2} \eta r v = \frac{4}{3} \pi r^2 \rho g - \frac{4}{3} \pi r^3 \rho g$$

$$\text{or, } 6 \frac{1}{2} \eta r v = \frac{4}{3} \pi r^3 (\rho - \sigma) g$$

$$\therefore \eta = \frac{2 r^2 (\rho - \sigma) g}{9 v}$$

(ii)  $\rightarrow$  falling of oil raindrops.

$$(a) \rightarrow dx = 2.5 \text{ m}$$

$$\eta = 10^{-3} \text{ decapoise}$$

$$F/A = 2 \times 10^{-3} \text{ N m}^{-2}$$

$$dv = ?$$

$$F = \eta \cdot A \cdot \frac{dv}{dx}$$

$$dv = \frac{F \cdot dx}{A \cdot \eta}$$

$$\text{or, } dv = \frac{2 \times 10^{-3} \times 2.5}{10^{-3}} \therefore dv = 5 \text{ m s}^{-1}$$

(10)

(a)

$$\rightarrow I_{rms} = \frac{I_0}{\sqrt{2}}$$

Virtual value of A.C.  $150.707 \text{ Hz}$   
Peak value of A.C.  $=$

⑧ ~~for~~  $I = 10.5 \text{ mA (rms)}$

$$W = 50 \Omega$$

$$295 = 10 \Omega$$

$$f = 28 \text{ Hz}$$

$$\text{OH} \rightarrow I_{rms} = \frac{V_1}{\sqrt{2}} = \frac{V_2}{\sqrt{2}} = \frac{0.9707 \text{ mA}}{\sqrt{2}} \quad 1.41 \text{ mA}$$

$$I = I_0 \sin(\omega t - \phi_2)$$

From graph, It is seen that alternating current lags behind alternating e.m.f. by phase angle  $\phi_2$ .

$$\rightarrow E_v = 50V$$

$$f = 50Hz$$

$$L = 0.02H$$

$$R = 50\Omega$$

$$\text{p.d across res for } (V_R) = 220V$$

Let  $r$  be the resistance of the solenoid, the impedance in the circuit,

$$Z = \sqrt{(R+r)^2 + X_L^2}$$

$$= \sqrt{(40+r)^2 + 4\omega^2 L^2}$$

$$= \sqrt{(40+r)^2 + 4 \times 10^4 \times 2000^2 \times 0.04}$$

$$= \sqrt{(40+r)^2 + 40000}$$

The current through the circuit =  $\frac{VR}{R}$

$$\frac{220}{40}$$

$$= 5.5A$$

Impedance of the circuit =  $\frac{6V}{IV} = \frac{50}{0.5} = 100$

$$\sqrt{(40+r)^2 + 40000} = 100$$

$$\text{or, } (40+r)^2 + 40000 = 10,000$$

$$\text{or, } (40+r)^2 = 10,000 - 40000$$

$$\text{or, } 40+r = 77-r$$

$$\therefore r = 37.5 \Omega$$

$$(11) \quad v_0 \int_{x_1}^{x_2} (v^2 + w^2) \cdot dx$$

$$v_0 \int_{x_1}^{x_2} \alpha W B dx$$

$$= \frac{2 \alpha^2 W B}{2} \int_{x_1}^{x_2} dx$$

$$= \frac{2 \alpha^2 W B}{2} = \frac{4 \alpha^2 W B}{2}$$

$$= \frac{5 \alpha^2 W B}{2}$$

(b)
